

The profile page allows coders to both view and manage their profile details. It features a form enabling them to update their avatar, first name, last name, and bio. However, it's important to note that the email and password fields are immutable and cannot be altered.

0 Correct submissions

Tasks

1. Page Layout

- Create a component called Profile that will host the content of the profile page.
- Add the page to the routes under /profile.

2. Profile Form

- Create a ProfileForm component that contains the form as shown in the previous picture.
- Add input fields for first name, last name and email.
- Make sure that the email is read-only field.
- Add textarea input for the about field.
- At the top of the form, include a file input field represented as an edit icon positioned next to the avatar preview image field. This allows the user to upload a new avatar image.
- For the avatar, once the user clicks on the edit icon, a file explorer should open up, allowing the user to select an image. Once an image is selected, it should be previewed within a circle on the profile page.
- Rank of the coder should be displayed as shown in the above picture.
Hint 1: There should be an onChange handler for the edit input, the uploaded files data can be accessed via **event.target.files** which is an array, so you must select the first file.

Hint 2: In order to preview the file of that uploaded image, you can make use of `URL.createObjectURL()` and you pass the uploaded file to it, you can find more about it [here](#).

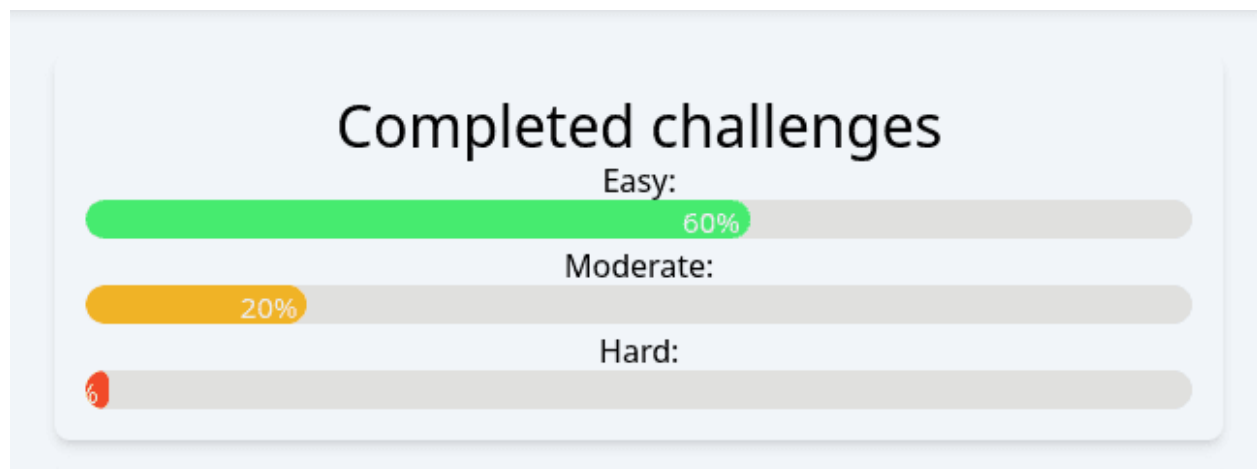

3. Statistics Components

On the right hand side of the page, we show general statistics about the coder's performance

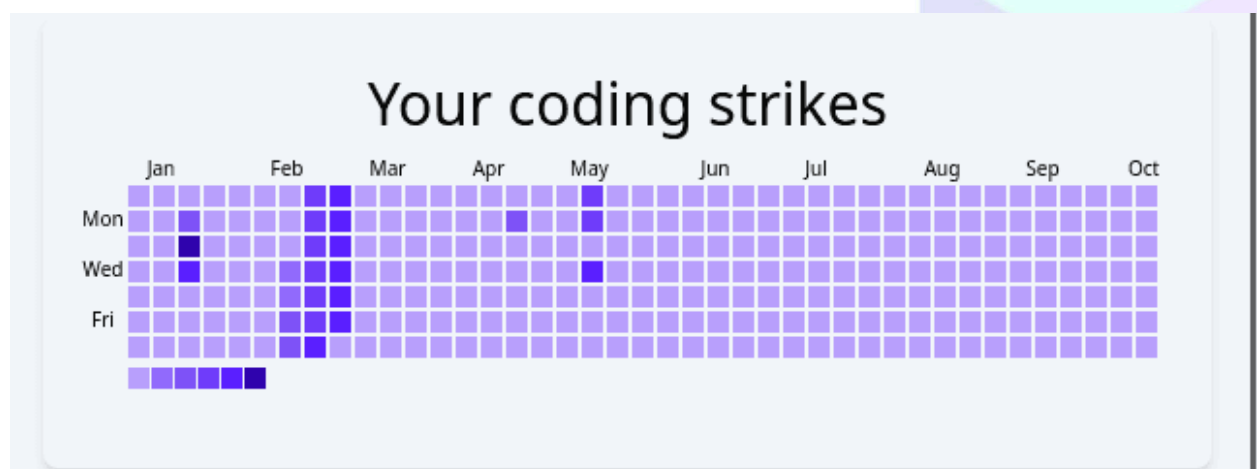

- Implement a component that displays statistics for completed challenges percentages. You can add a label to show the ratio of

completed challenges, for example, "30 / 50", which means 30 challenges out of 50 are solved, corresponding to 60%.

Note: Once you implement the backend part you'll be sending the number of solved challenges and the total number of challenges of a specific difficulty level and you calculate the percentage in the frontend side.

- Implement a submission strikes heatmap that displays the number of **accepted** submissions over the last year. You can utilize the react-heat-map library for this purpose.

You can use this pannel color scheme for the dark and light themes.

```
const pannelColor = {  
  dark: {  
    0: "#fadfc3",  
    2: "#fcca95",  
    4: "#fcbc77",  
    10: "#ffaf59",  
    20: "#fc9b32",  
    30: "#fa5902",  
  },  
  light: {  
    0: "#b89ffc",  
    2: "#916afc",  
    4: "#7e52f7",  
    10: "#6f3cfa",  
    20: "#5a1fff",  
    30: "#2f03ad",  
  },  
};
```

4. Responsiveness and Theming

The following is the UI for small screen sizes
